The **COVERCREASE** system for Saddlestitcher Cover feeders, the "Ultimate system" for creasing your heavy covers on the run.

Manufacturers of saddle stitching machinery have always used a method of scoring on their cover feeders which rarely produces an acceptable spine on a book on anything other than a light cover stock. (200 grammes or less)

*To Address this problem a **COVERCREASE** Reverse creasing head has been designed for every cover feeder on the market today, no matter what the fitting method used by individual manufacturer. The **COVERCREASE** head has three female grooves which will accommodate the wide range of custom produced creasing matrix strips which are simply attached to the surface of the cover feeder drum. The most commonly used being the standard 2 or 3 point letterpress matrix.*

COVERCREASE can be fitted to your machine in 10 minutes using the fully illustrated instructions supplied with the kit. The result?...no more cracking of covers right up to 375gsm, no more pre creasing on a letterpress cylinder. Worried about consumable costs?...each matrix strip costs £3.00 plus vat each and each strip will crease 500,000 copies, 0.000006 pence plus vat per copy!.

Try out this remarkable system on your machine, you'll love the results!
